

# Data Provision Planning

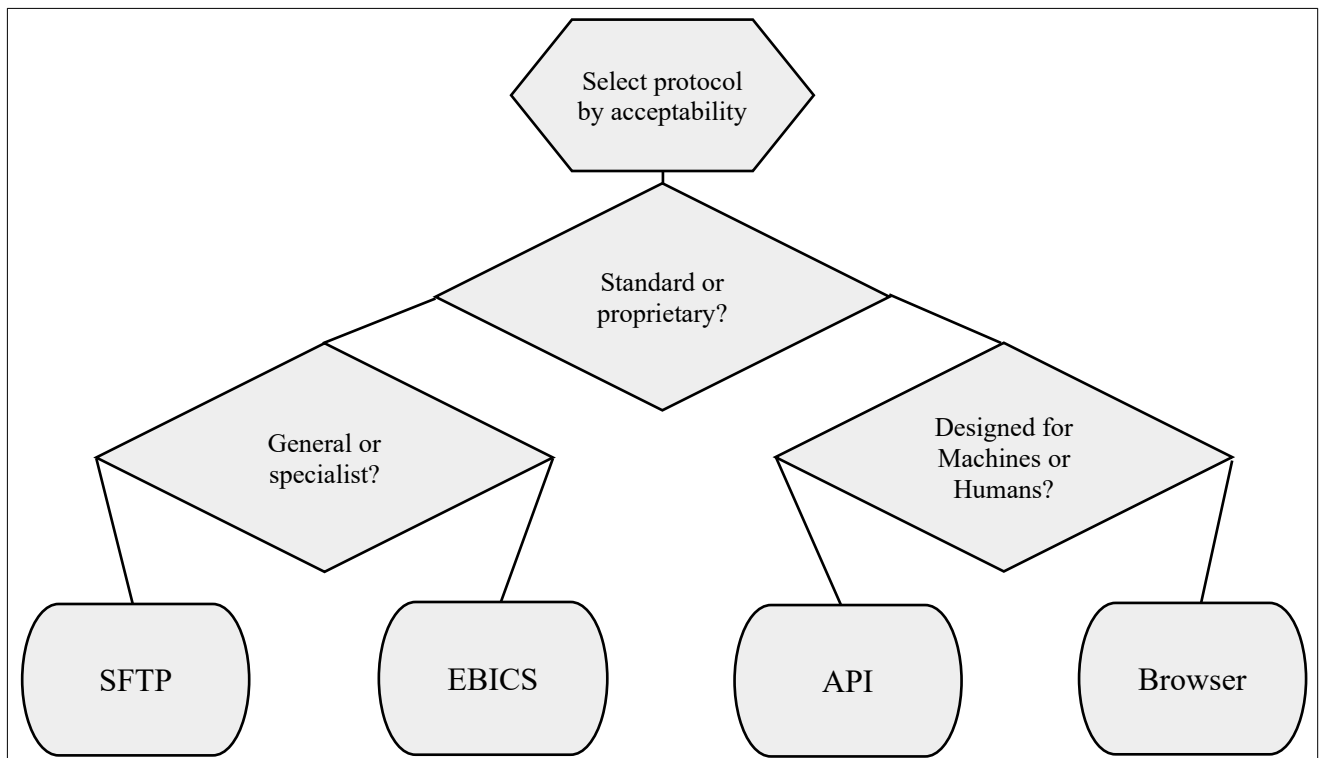

## Goal:

To mutually agree on a secure, reliable, maintainable & efficient mechanism for file transfer between parties. Without putting excessive burden of time, effort or cost on either party during implementation or on-going.

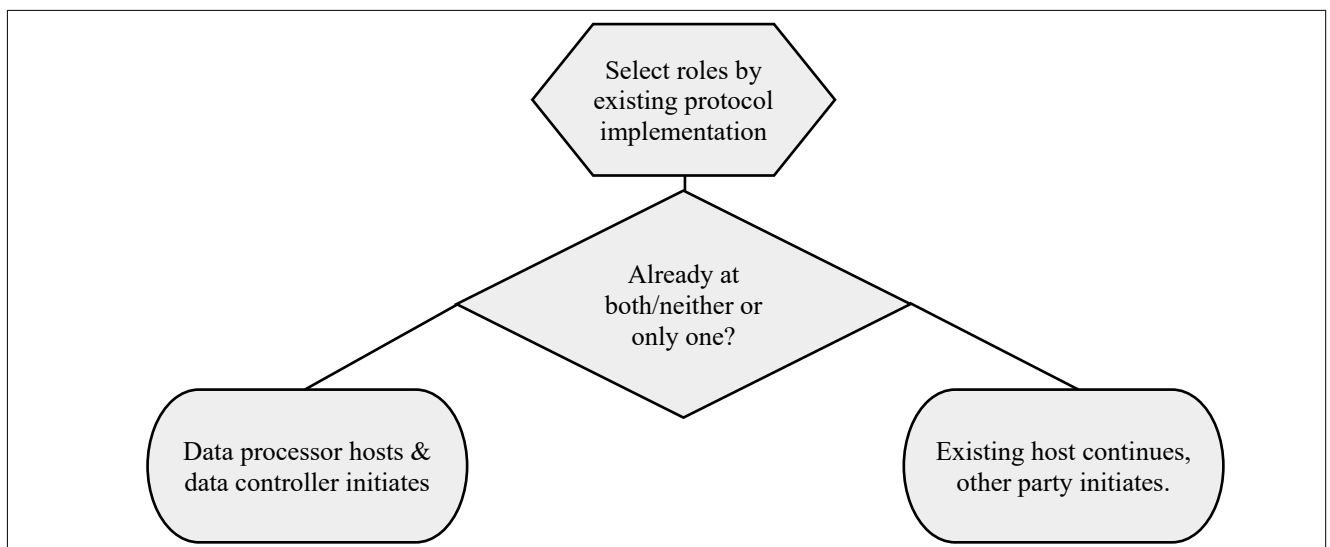

## Limited menu

Any system which can securely transfer files across the public Internet, will be complex in the details but in the scope of early planning need only be considered broadly in comparison with other similar systems.

As **data processor**, our “Data Provision Guidelines” has a short list of our preferred file transfer protocols.

The **data controller** advises of their acceptable protocols, probably based on familiarity. The winning protocol is the left-most in the above list due to suitability & ease of automation.

The roles are decided by ease of implementation over transfer latency.
